Precisely Data360 for Healthcare

The Challenge

While healthcare is among the fastest growing industries, it is also one of the most difficult when it comes to data management. Complex compliance demands, massive volumes of structured and unstructured data, many source systems and locations can all impede efforts to turn data into trusted and impactful actionable insights.

Healthcare organizations need expert guidance and integrated tools to effectively govern and use data for better patient health, innovation, increased efficiency and decreased costs. As they leverage data to achieve these objectives, common issues include:

- How do we use data governance to solve typical healthcare challenges—and where do we start?
- How do we improve and protect data quality?
- How can we get our analytical models to produce the desired results?
- How can we ensure consistent reporting on key metrics?

To answer these questions, you need an enterprise data management solution that drives data value through data governance, data quality and data analytics.

The Solution

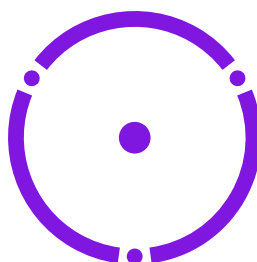

For nearly five decades, Precisely has helped healthcare organizations solve their data challenges. The Precisely Data360 solutions protect and improve the quality of your data, ensures you know its location, meaning and use and allows you to rapidly build and easily adjust data flows and data analysis for better operational and clinical insights. These integrated capabilities enable you to make better business decisions and achieve excellent outcomes.

How Precisely Helps:

Maximize Data Value

Do you need help to fully understand your data landscape, so you may better leverage data to achieve your most critical objectives? Our Strategic Services team of data experts will work with you to assess the state of your data landscape, identify needs and prioritize them, and help you execute a plan to maximize the value of your data, drive results and increase ROI.

Healthcare data can reveal powerful insights that don't just deliver better outcomes—they can literally save lives.

Data Governance
Data Quality
Data Prep & Analytics

Improve the Governance and Quality of Care Management Data

Care management requires the integration of data from multiple sources to provide visibility into a patient's overall health, chronic condition or acute illness. We assure appropriate oversight and accurate, consistent and reliable care management data for the best care and outcomes.

Ensure Accuracy of Your Provider Data and Directories

Provider data tends to be one of the most complicated data sets to manage. This is in part because it is always changing, but also many sources from which to obtain this data and it is needed in many internal systems for credentialing, contacting, claims and directories. This data needs to be actively managed and views provided to business stakeholders to ensure accuracy and avoid fines.

Reconcile Value-Based Reimbursement Payments

As VBR payments are sent and received, are you sure the amounts are accurate? Precisely can perform complex reconciliations to confirm accurate payments, establish rules around payment methods and frequency, and trigger workflows to investigate when amounts received do not match expected amounts within required timeframes.

Track Patients or Members

Can your tracking of individuals, claims, payments, accumulators and encounters be improved? We ensure unique members and patients are correctly identified and their data accurately tracked as it moves within and between systems and processes, eliminating duplicates and ensuring accurate reconciliation between systems and partners.

Ensure Accuracy of Your Clinical Data

Are your data exchanges costing you? Value Based Reimbursement (VBR) arrangements, clinical variation analyses and other interactions require complete and accurate exchange of clinical data between providers and payers. We ensure the smooth exchange of data, as well as prompt identification and timely issues resolution.

Extract Better Insights from Analytics

The key to timely, reliable data insights begins with quality data that doesn't degrade as it moves through systems and processes. Agile self-service analytics empower users with different skillsets to quickly access virtually any data source and perform fast analysis for trusted, meaningful insights.

Govern Your Compliance and Reporting Efforts

Can you easily identify the data and processes involved in reporting for measures such as HEDIS or STARS? Do you know the location of all personal data or protected health information (PHI)? We help find and track sensitive data for HIPAA, CCPA and other regulations, and detect data or process changes that impact compliance and reporting requirements.
